PROJECT TITLE: CRICKET RESEARCH LAB: A DATA SCIENCE PLATFORM FOR INVESTIGATING HISTORICAL PATTERNS IN INTERNATIONAL TEST AND ONE-DAY CRICKET

MODULE PHOTOGRAPHS:

SYSTEM ARCHITECTURE	MODULE DESIGN	PRESENTATION IMAGE
		

PROJECT DESCRIPTION:

In this project, I developed Cricket Research Lab, a data science platform for analysing historical patterns in international Test and One-Day cricket.

Purpose

The platform processes historical cricket data and presents meaningful insights through statistical analysis and interactive visualisations.

Input/Data

The system uses JSON-based cricket match data containing details such as teams, scores, venues, dates, and player-of-the-match information.

Processing/Techniques

- An ETL pipeline extracts and transforms data into a structured format.
- Data validation ensures consistency and reliability of the processed dataset.
- Analytical techniques are used to examine team scores, yearly match trends, venues, and player-of-the-match statistics.
- Results are presented through an interactive dashboard.

Output/Result

The system produces a validated dataset and interactive analytical views, enabling users to explore historical cricket performance and identify meaningful trends using a complete data extraction, processing, analysis, and visualisation workflow.
